ATSsim 3.0 Release Notes

08/05/2022
Version 1.22

General Changes

- Updated our atssim-permissions library to 2.0.1 after some enums were updated. Then, updated all our services to use this new version [ATSSIM-2733]
- Added additional logging on Key Actions taken during the event lifecycle to enable additional tracking and debugging of an event [ATSSIM-2748]
- Updated duplicate event process to ensure that we use the new event name as the name for the GIS output file(s) if GIS is enabled. [ATSSIM-2768]
- Added a pop-up modal to alert user that their session expired when making page changes or rest calls while in an expired session. [ATSSIM-2756]
- Granted all roles permission to update their own account information in account settings. [ATSSIM-2780]

Master Scenario Event List (MSEL)

- Updates to support integration with WebEOC. An update was made to only send injects to a configured WebEOC instance when the inject type is WebEOC. Changed the requirements for a WebEOC inject to only require a Subject and Message. Removed the current functionality of sending an email to a recipient(s) in lieu of sending to WebEOC. Updated WebEOC inject type to only be visible and selectable when WebEOC is enabled. [ATSSIM-2669] [ATSSIM-2777]
- Fixed issue in exercise script panel where #scroll-area was not found. Scrolling to selected drop down now works when creating or editing an inject. This change has no visible impact on users of ATSsim, fixed a client-side error that was being thrown. [ATSSIM-2699]
- Fixed an issue where when updating an inject to change its message type caused an issue on an invalid end date. ATSsim was automatically setting the end date to the current date/time which was causing the issue, since we don't use the end date/time of an inject for anything we change it to set it to null. [ATSSIM-2743]

- Fixed an issue changing Planning Protocols didn't update the page title for Exercise Script/Master Scenario Event List based on the Planning Protocols selected at event creation. [ATSSIM-2752]
- Fixed an issue where users with the role MSEL Manager could not complete injects. [ATSSIM-2735]
- Fixed an issue where, during import of a MSEL, nonexistent role ids can be used. This caused an issue when the inject was viewed after import where the senders/recipients were empty [ATSSIM-2744]

Event Planning

- Updated Facilitator system role given to every event to also have the permissions within the Observer and MSEL Manager roles. [ATSSIM-2731]
- Updated Facilitator role to no longer permit them to create event planning groups. [ATSSIM-2742]
- Fixed an issue where in the Post Event Reporting (Observation List section) would fail to update observation data when users updated data. [ATSSIM-2734]
- Added the ability to add multiple participants to an event with the same role [ATSSIM-2775]

Simulation Capability

- Removed access to Task Organization context menu for Observer and Lead Observer event roles. [ATSSIM-2739]
- Updated inject sorting to sort injects with the same start time in numerical inject number order within a start date/time. [ATSSIM-2751]
- Fixed issue where reports would fail to generate when trying to view/download reports with a large amount of data points. [ATSSIM-2758]
- Updated PERSTAT downloads to use the same file naming format of LOGSTAT and SITREP downloads. [ATSSIM-2782]

User Management

- Cleaned up remote procedure calls that are no longer used by ATSsim by deleting them from our code base. This has no direct impact on the users of ATSsim. [ATSSIM-2555]
- Updated User Organization API to throw a 404 error when an invalid organization id is provided as input into the PATCH, PUT, and GET calls.

This has no impact on current users of ATSsim, updated to round out and complete the API. [ATSSIM-2685]

Observer Tool

- Added Inject Status Legend in Observer MSEL list showing the colors corresponding to which inject status [ATSSIM-2740]

Administration Pages

- Fixed issue where events could not be stopped in the Admin Running Events page. [ATSSIM-2715]
- Fixed an issue where the number of running exercises would show all running exercises for every organization instead of just the organization that the user had permission to see. [ATSSIM-2736]
- Updated permissions on the Activate and Deactivate functions on a Published Task Org. Event Creators, Organization Admins, Regular Users, and Master Sim Components Editors can no longer activate or deactivate published task orgs. [ATSSIM-2682]
- Updated Entities page to show active entities by default instead of both active and inactive. [ATSSIM-2686]
- Updated create/edit organization to remove "field is required' on both the email and phone text box when either one is filled out correctly [ATSSIM-2689]
- Updated the creation of a license process to ensure that users cannot create a date prior to the current date. [ATSSIM-692]
