

ATSSim 3.0 Release Notes

10/3/2022
Version 1.23

General Changes

- Introduced ability to track and record specific in-exercise actions taken by participants throughout an exercise. This enables ATSSim to log significant or key actions taken for debug and future reports. This change has no visible impact on the users of ATSSim and is merely capturing additional data during an exercise for use in the future. [ATSSIM 2823]

Event Planning

- Several updates were made to the Capabilities and Task page. Added a description of the purpose of the page and what users should do when adding capabilities and tasks. Also, updated the page to keep the Add Capability button pinned to the top of the page when multiple capabilities were being added. [ATSSIM-1527]
- Several updates were made to the Training Objectives page. When adding a new training objective, the Training Objective panel will default to no organizations selected, allowing the planners to select which organizations. Also, a Select All and Deselect All button when adding training objectives for multiple organizations. If the user selects an organization on the main page, then selects to add an objective for that organization, the organization will bill auto selected on the Add Training Objective panel. [ATSSIM-2831]
- Added the ability to select and configure which optional metadata attributes should be made available in the event, instead of providing a list for the MSEL builder to pick from. Now the planners can define which attributes could be used [ATSSIM-2899]

Exercise Conduct

- Fixed a defect that was not allowing a Facilitator to approve or deny a request from an observer to mark the Inject as Complete. The fix now allows a facilitator to approve/deny a request. [ATSSIM-2895]

User Management

- Fixed a defect that caused reset password email to never send to User when they requested their password to be reset. [ATSSIM-2779]
